

Introduction to JBoss Application Server 5.0

Paris JUG, 2nd of December 2008

Sacha Labourey
CTO JBoss, a division of Red Hat

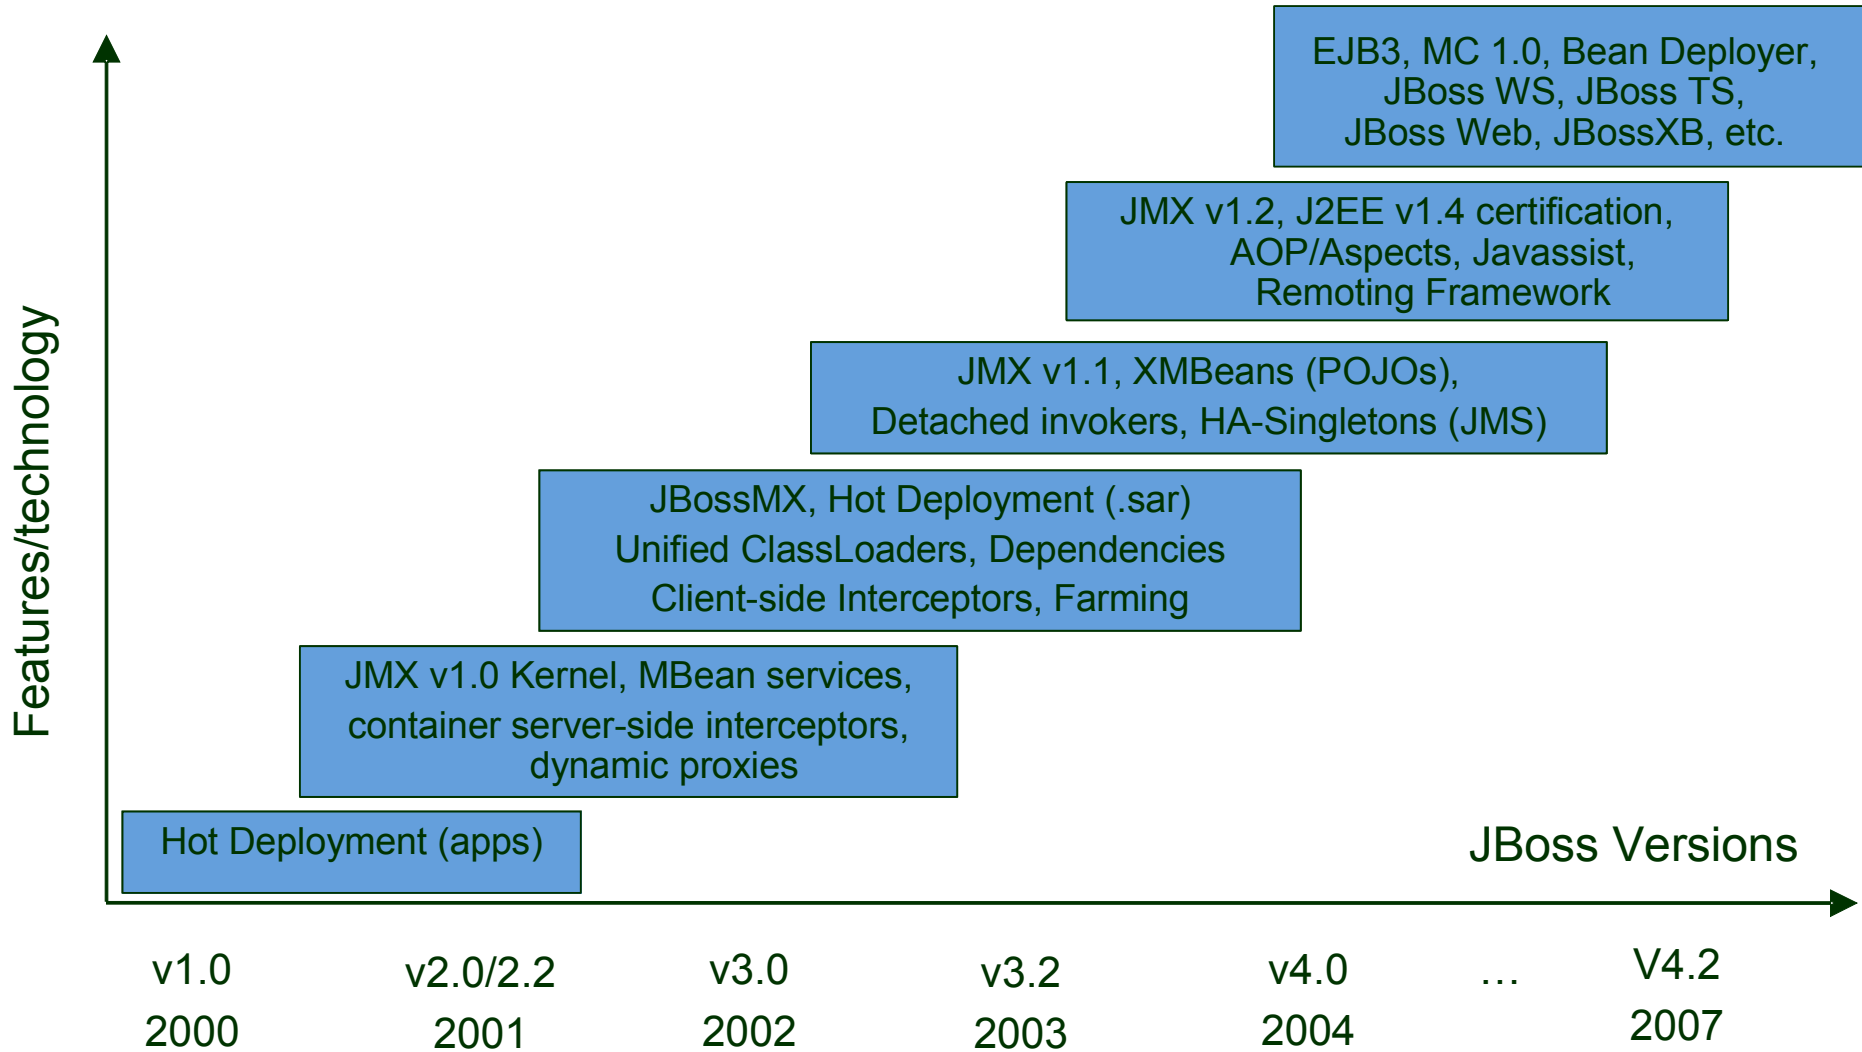

Agenda

- A History of Innovation
- AS 5 Goals
- Why do we need this? Where is the market heading towards?
- AS 5 Kernel Overview
- New Feature Highlights
- Q&A

A History of Innovation

JBoss AS History

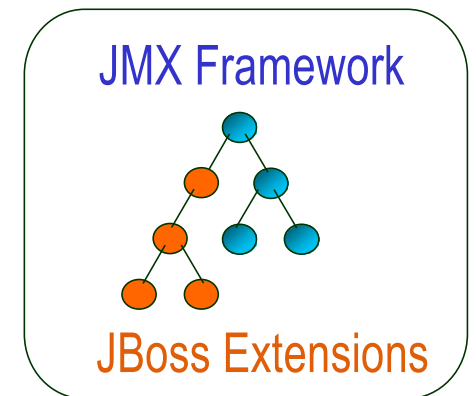

Architectural Innovations

- The JBoss Kernel
 - A lightweight component framework that wires together a set of Services.
 - Services are de-coupled, invocations are routed through an internal bus.

JMX MicroKernel – Pros (JBoss AS 3.x/4.x)

- Hijacking JMX as the basis for the JBoss Kernel was a brilliant idea, at the time:
 - Extending the server was very easy
 - A big part was already implemented
 - Get JMX management for free.

JBoss MicroKernel

JMX MicroKernel – Cons (JBoss AS 3.x/4.x)

- No native support for POJOs
- No configuration API
 - Difficult to persist configuration changes
 - Difficult to provide advanced tool support
- Ad-hoc extensibility
 - Implicit/hidden dependencies
 - Few clean internal APIs/SPIs
- Runtime Embedability
 - JMX Dependency and limited environments (e.g. J2ME)
 - No standalone project

AS 5 Goals

JBoss AS 5 Goals (1)

- Deliver a Java EE 5 certified application server

- Take every major subsystem to the next level
 - Clustering Infrastructure
 - Messaging Service
 - Security Modules
 - Transaction Manager
 - Web Services Stack
 - Web Server
 - ...

JBoss AS 5 Goals (2)

- Create the most advanced server runtime architecture
 - Next Generation POJO-based Kernel (Microcontainer)
 - Small, Standalone, Embeddable, Testable
 - New Aspectized Deployers
 - New Configuration API (Profile Service)
 - New Classloading architecture
 - Support for many component models
 - Legacy JMX MBean Services
 - OSGi bundles
 - Other...

Why do we need this?

-

Where is the EE market
heading towards?

Number of EE vendors - Consolidation

- Let's look at the numbers:
 - J2EE 1.2 : 18 vendors
 - J2EE 1.3 : 22 vendors
 - J2EE 1.4 : 17 vendors
 - EE 5 : 10 vendors
 - Actually IBM, ORCL, SUN, SAP, NEC + Kingdee, TMaxSoft
 - EE 6: ?
- More consolidation, less choice.
 - “True” vendors: Red Hat, IBM, Oracle (& SUN)

Consolidation – Less Open Standards

- Number of new JSR started on the JCP

Consolidation – Less Open Standards

- Do vendors benefit from Open Standards in a consolidated market?
 - No, not really:
 - Common playing field? No market share to win
 - Ease Migrations? Certainly not.
 - Enhance competition? No, this leads to lower margins

=> Incentive for vendors to push Open Standards is low on a consolidated market

=> Most FOSS models **do** benefit from Open Standards

Where are we heading towards?

- 1) We are OPEN
- 2) We are ENTERPRISE READY
- 3) We have a NEXT.GEN architecture

(And will remain so.)

JBoss AS 5.0 runtime

EE Container

RoR Container

OSGi module

EE Container

*Spring
Container*

...

Middleware Services

Persistence

Messaging

Clustering

Security

...

Deployers

EE

POJO

OSGi

Spring

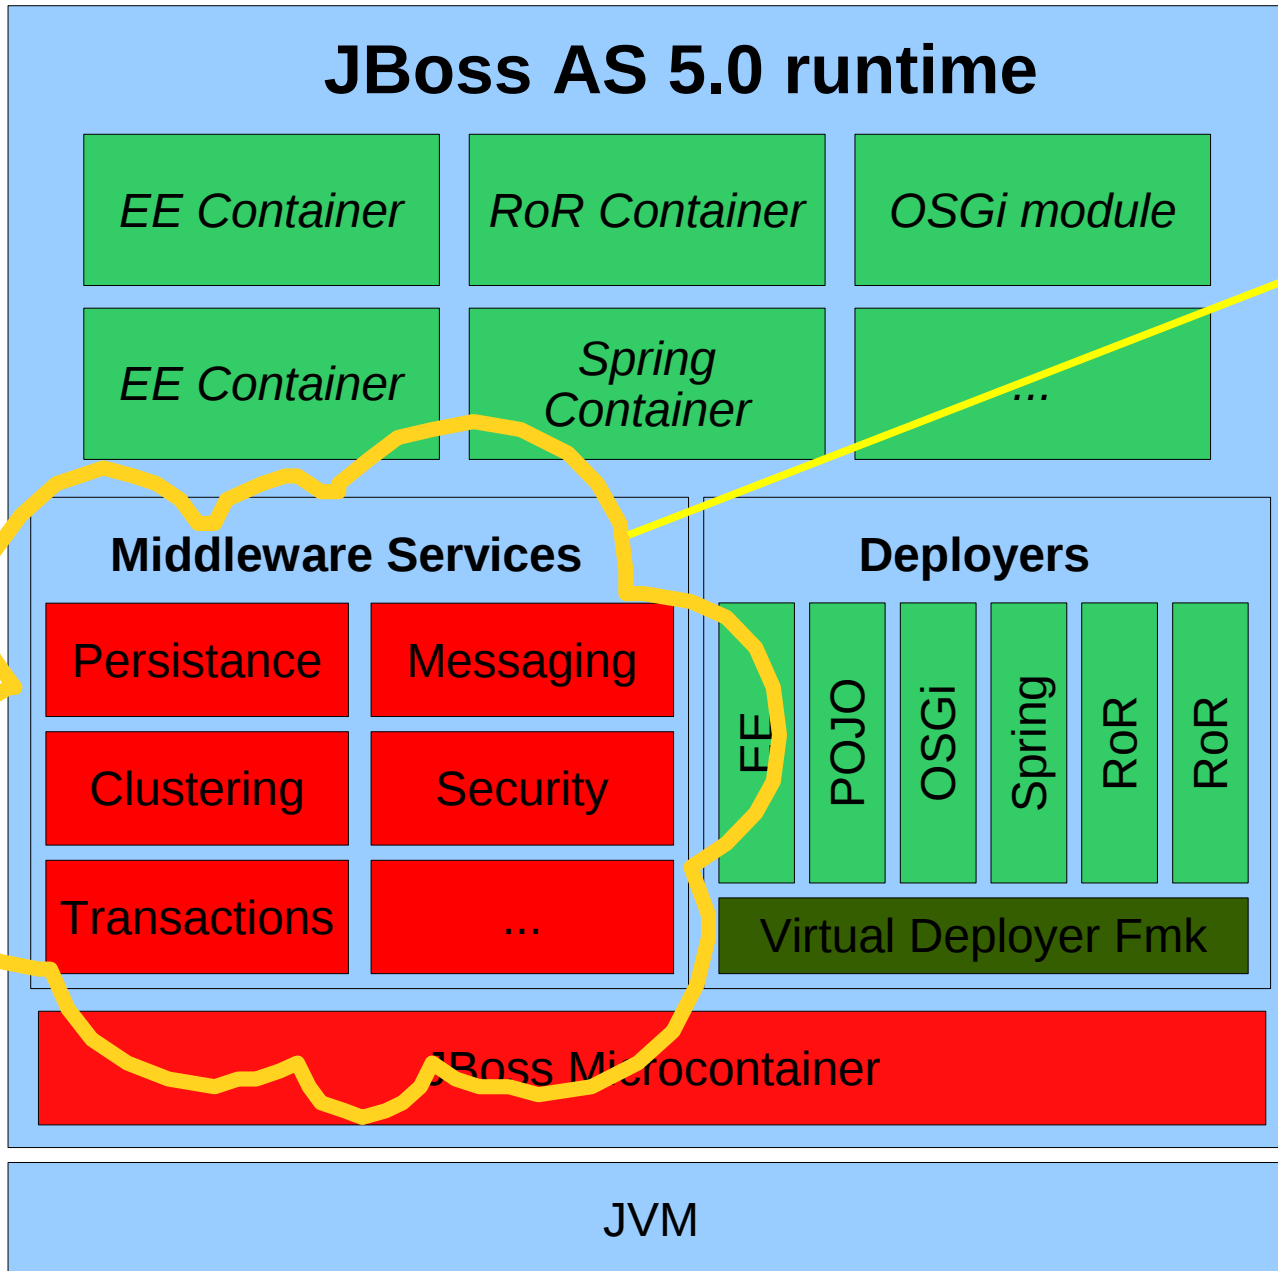

RoR

RoR

Virtual Deployer Fmk

JBoss Microcontainer

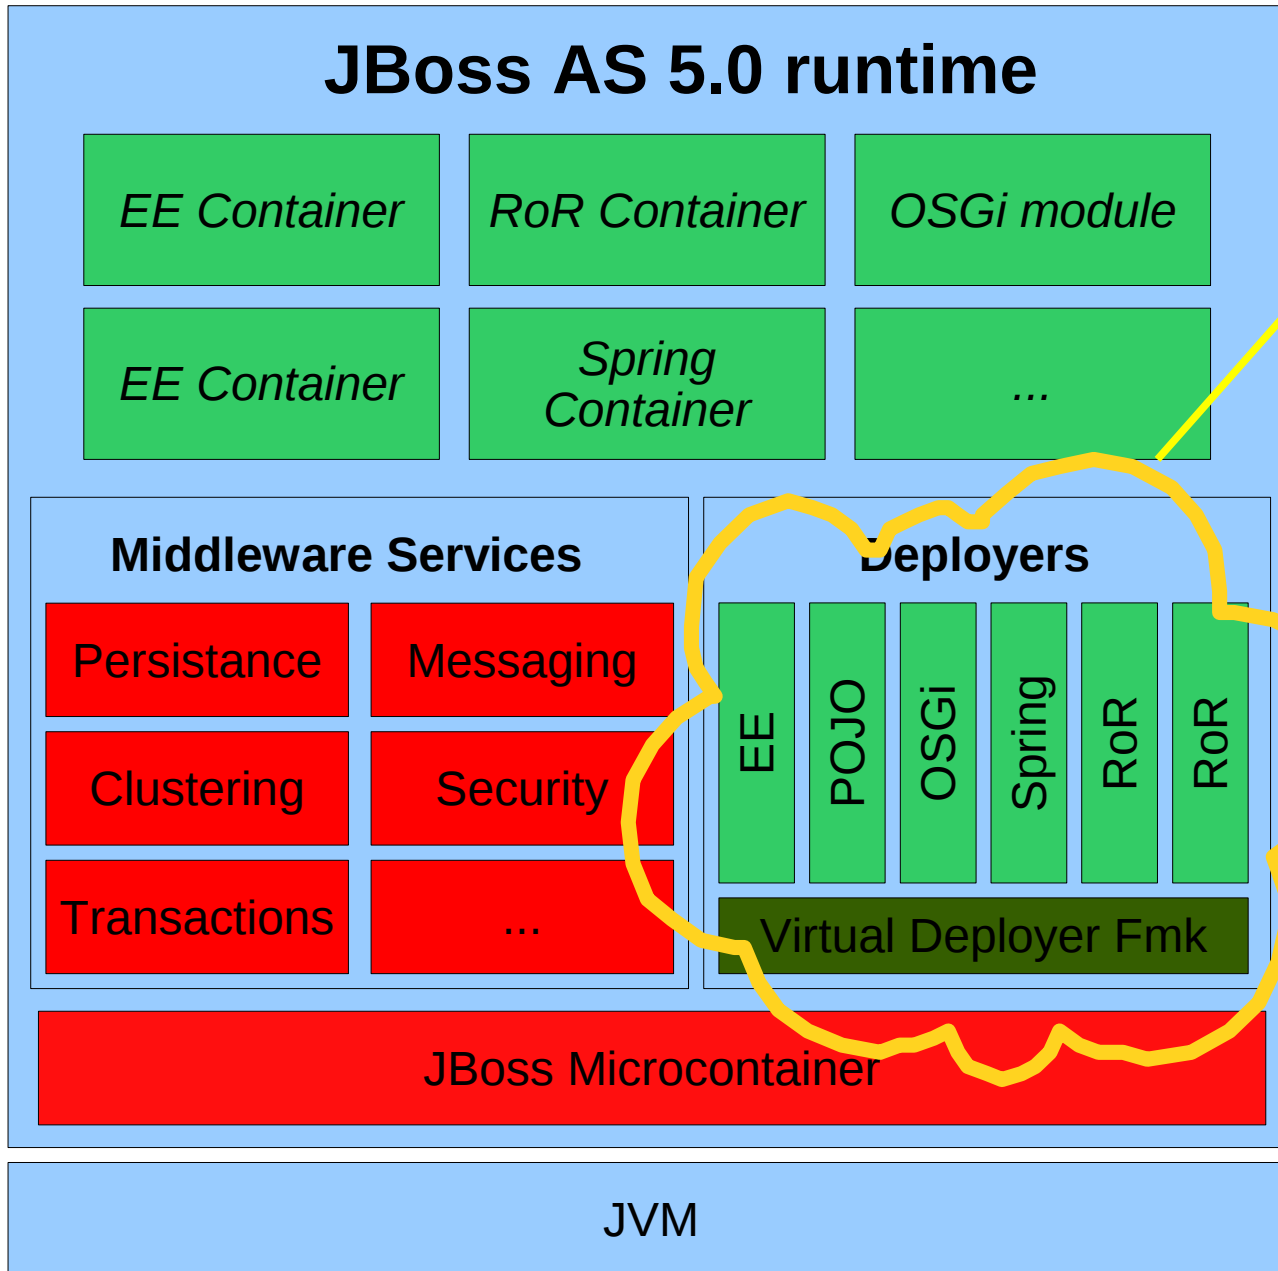

JVM

**Core
Middleware
Services
will remain!**

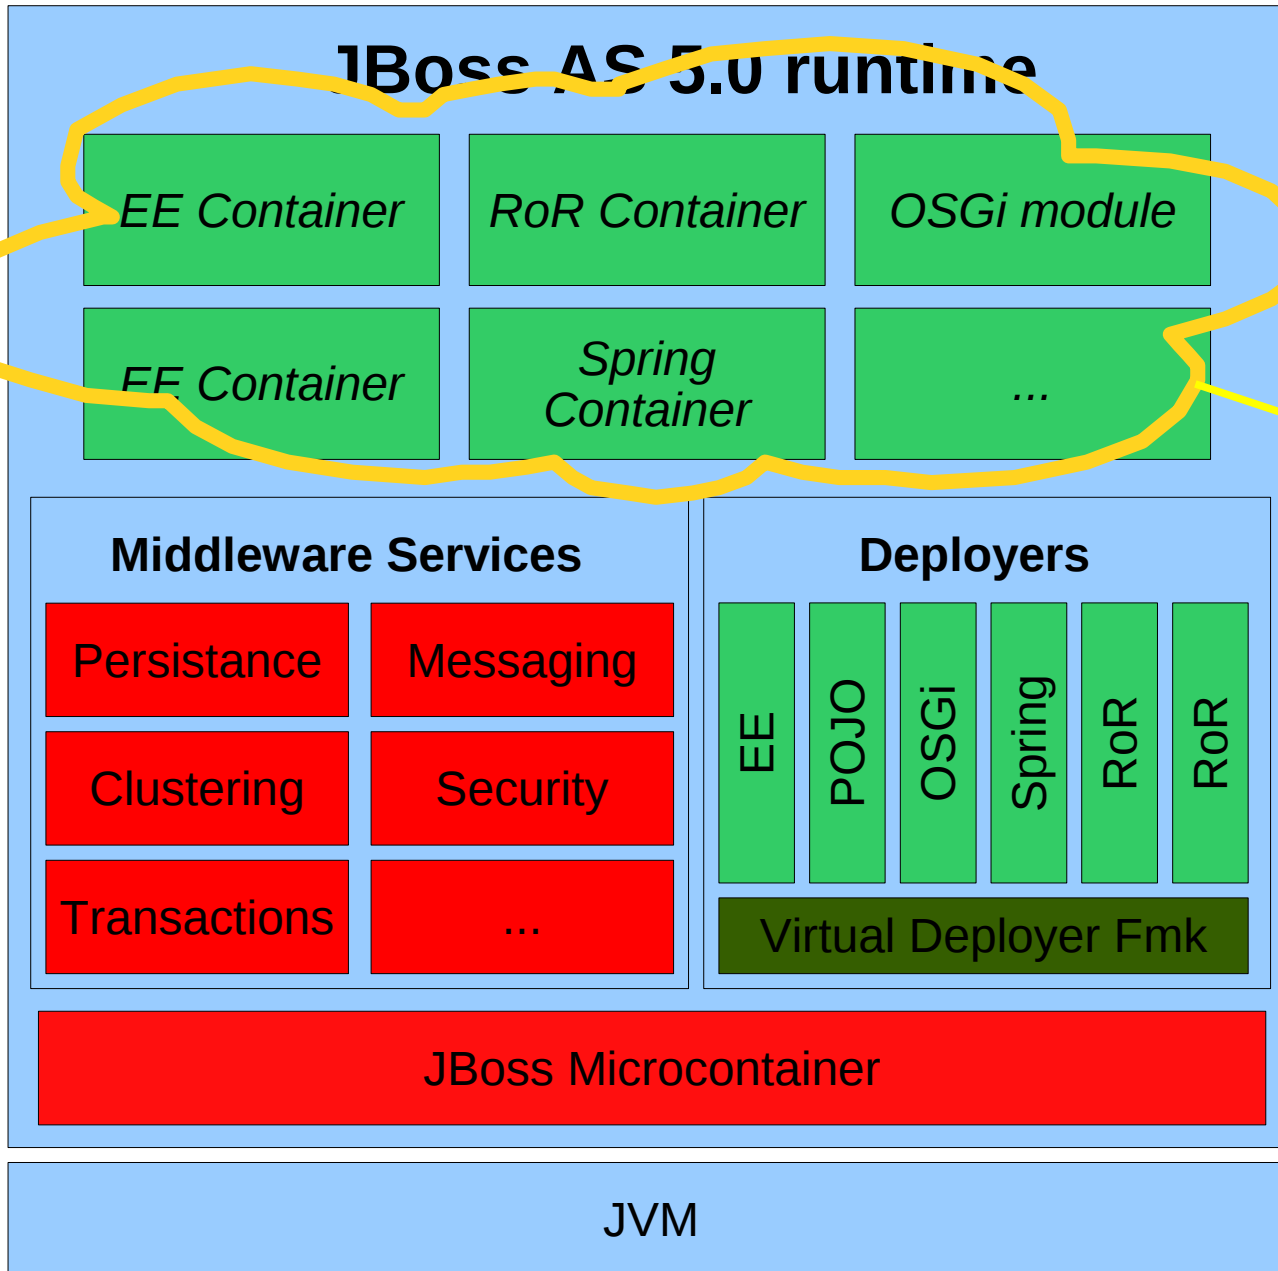

-
That is our DNA

-
**Those services
have to be rock
solid and
feature-rich.**

What is your programming model? EE? RoR? OSGi? Spring? Multiple of those?

- Deployers map programming model specific containers to core middleware services

This is the
“easiest” part
in middleware

-
We shouldn't be
imposing a
choice here

Next.Gen JBoss architecture (not just AS)

- Offer the most stable and most powerful enterprise middleware services
- Provide a flexible and powerful foundation (MC) to orchestrate these services
- Trivial to implement new programming model/API
 - No change in operations, testing of core services, interoperability, etc.

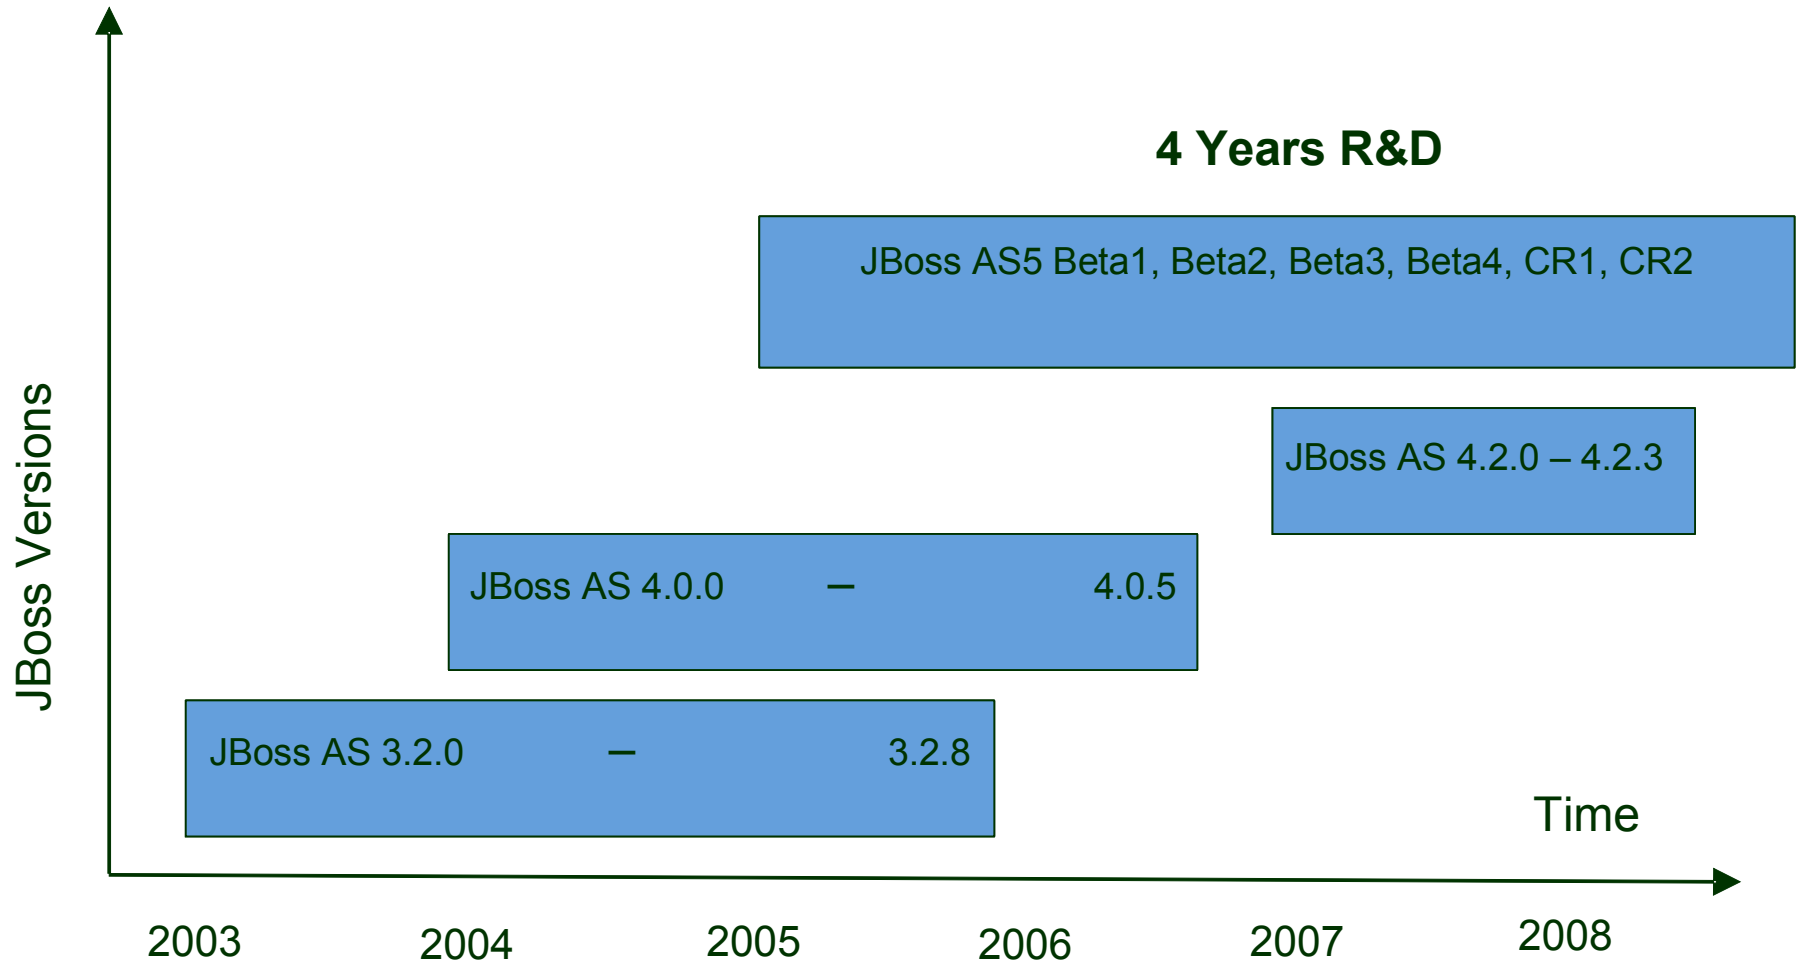

Long term sustainability of your investment.

AS 4.2 vs. AS 5.0

Smooth Migration

AS 5 Timeline

JBoss AS 4.2

- Stepping Stone from AS 4.x to 5.x
- Bundles AS5 features on top of the 4.x MicroKernel
 - JBoss EJB3
 - JBoss Web 2.x
 - JBoss Transactions v4.2
 - JBoss WS
 - Dependencies aligned with JBoss Messaging
- Basis of JBoss Enterprise Platform

The Community JBoss Application Server (AS) vs. the Enterprise Application Platform (EAP)

- A Fedora/RHEL type of split for JBoss
- Community Project (JBoss AS)
 - JBoss As We Know It
 - Sponsored by JBoss/Red Hat
 - Allow innovation at a faster pace
- Enterprise Application Platform (EAP)
 - Forks the community project at stable points
 - Integrates with JBoss Developer Studio / JBoss Operations Network
 - Rigorously tested (performance, scalability, SpecJ, etc.)
 - Certified on 17 OS and JVM combinations, 5 DBs
 - 3 month Cumulative Patch cycles
 - Supported for 5 years.

Forking EAP from JBoss AS

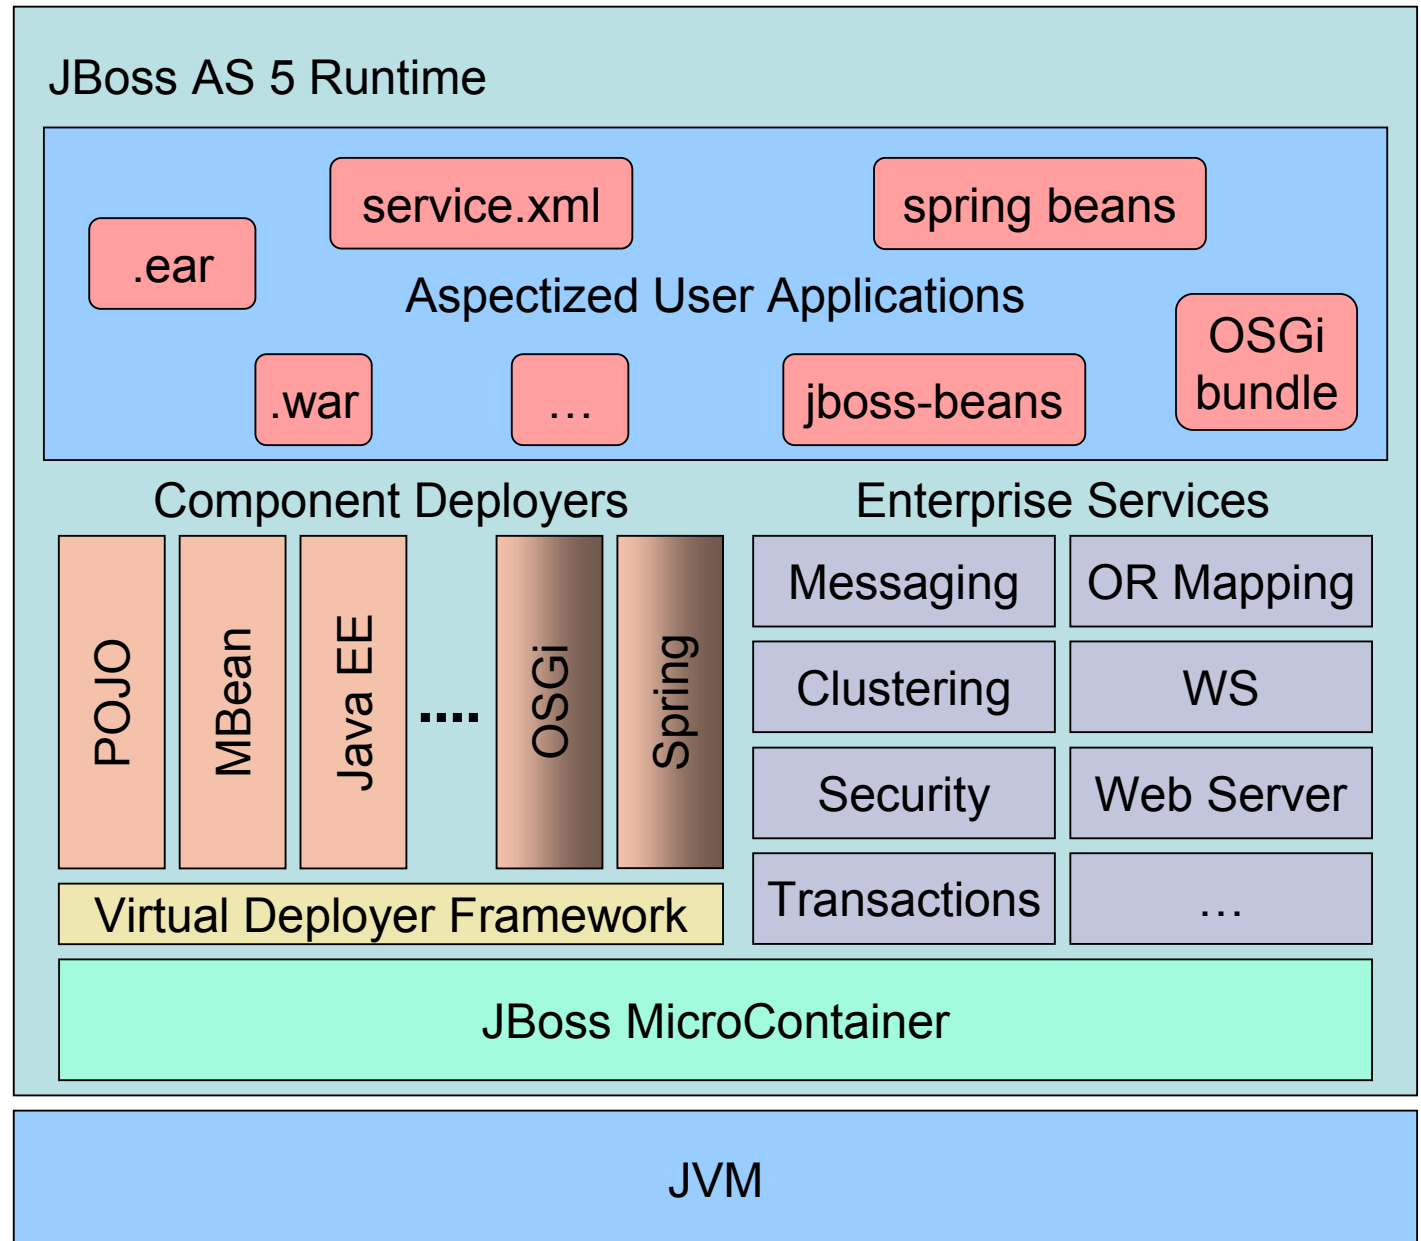

AS 5 Kernel Overview

The Big Picture

Runtime components wired together by the MC with dependencies and aspects applied across component models!

JBoss Microcontainer Core

- Dependency Module
 - An extensible State Machine (states, transitions, controller, callbacks)
- Container Module – Basic IoC
 - Object/Class (scoped) Metadata, Introspection / Reflection, Aspectization
- Kernel Module – Advanced IoC
 - Controller Modes: Auto, Manual, On-Demand
 - Deployer Install / Uninstall
 - Annotations
 - Classloaders
 - ...

JBoss Virtual File System (VFS)

- An read-only Archive abstraction for the Deployers, starting from a root URI/URL
 - Zipped vs Exploded archives
 - Nested archive
- Can create “virtual” archives in memory
 - Great for unit testing

...

```
AssembledDirectory jar =  
AssembledContextFactory.getInstance().create("ejbTestCase.jar");  
jar.addClass(Customer.class);  
jar.addClass(CustomerDAOBean.class);  
jar.addClass(CustomerDAOLocal.class);  
jar.addClass(CustomerDAORemote.class);  
jar.mkdir("META-INF").addResource("tutorial-persistence.xml",  
"persistence.xml");  
Bootstrap.getInstance().deploy(jar);
```

Notable differences

- JBOSS_HOME
 - lib/
 - common/lib/ - **NEW**
 - server/*config-name*/lib
- Configurations
 - minimal
 - web - **NEW**
 - default
 - all
 - [standard] - **NEW**

Deployer Types

■ Structural Deployers

- Recognise deployment types
 - User defined – META-INF/jboss-structure.xml
 - Specification defined – jar, war, ear, etc.
- Defines the structure
 - Where is the metadata? META-INF or WEB-INF, etc.
 - Where are the classes? / or WEB-INF/classes, etc.
 - What are the subdeployments?

■ Aspectized Deployers

- Each Deployer does one thing well
- Easy to control how much gets done
 - Off-line tool like the admin console only wants to do parsing
 - Runtime does everything
- Easy to swap out behaviour – e.g. change the classloader

Aspectized Deployers

■ Parsing Deployers

- Turns xml into a metadata model attachment
- e.g. my-beans.xml -> KernelDeployment

■ ClassLoading Deployers

- Creates classloaders from metadata
- e.g. Uses the information from the StructureDeployers

■ Component Deployers

- Splits complicated deployments into units
- e.g. KernelDeployment -> BeanMetaDatas

■ Real Deployers

- Does the real work of deployment
- e.g. BeanMetaData -> controller.install()

OSGi support

- Core OSGi Framework API
 - A Facade on top of the existing Microcontainer API
 - OSGi Bundle Repository (OBR)
 - Declarative Services Support (DSS)
 - Service Registry
- NIH Syndrome?
 - We want full integration with the MC runtime:
 - AOP
 - Metadata
 - VFS
 - Legacy JMX
 - Fine grained dependencies

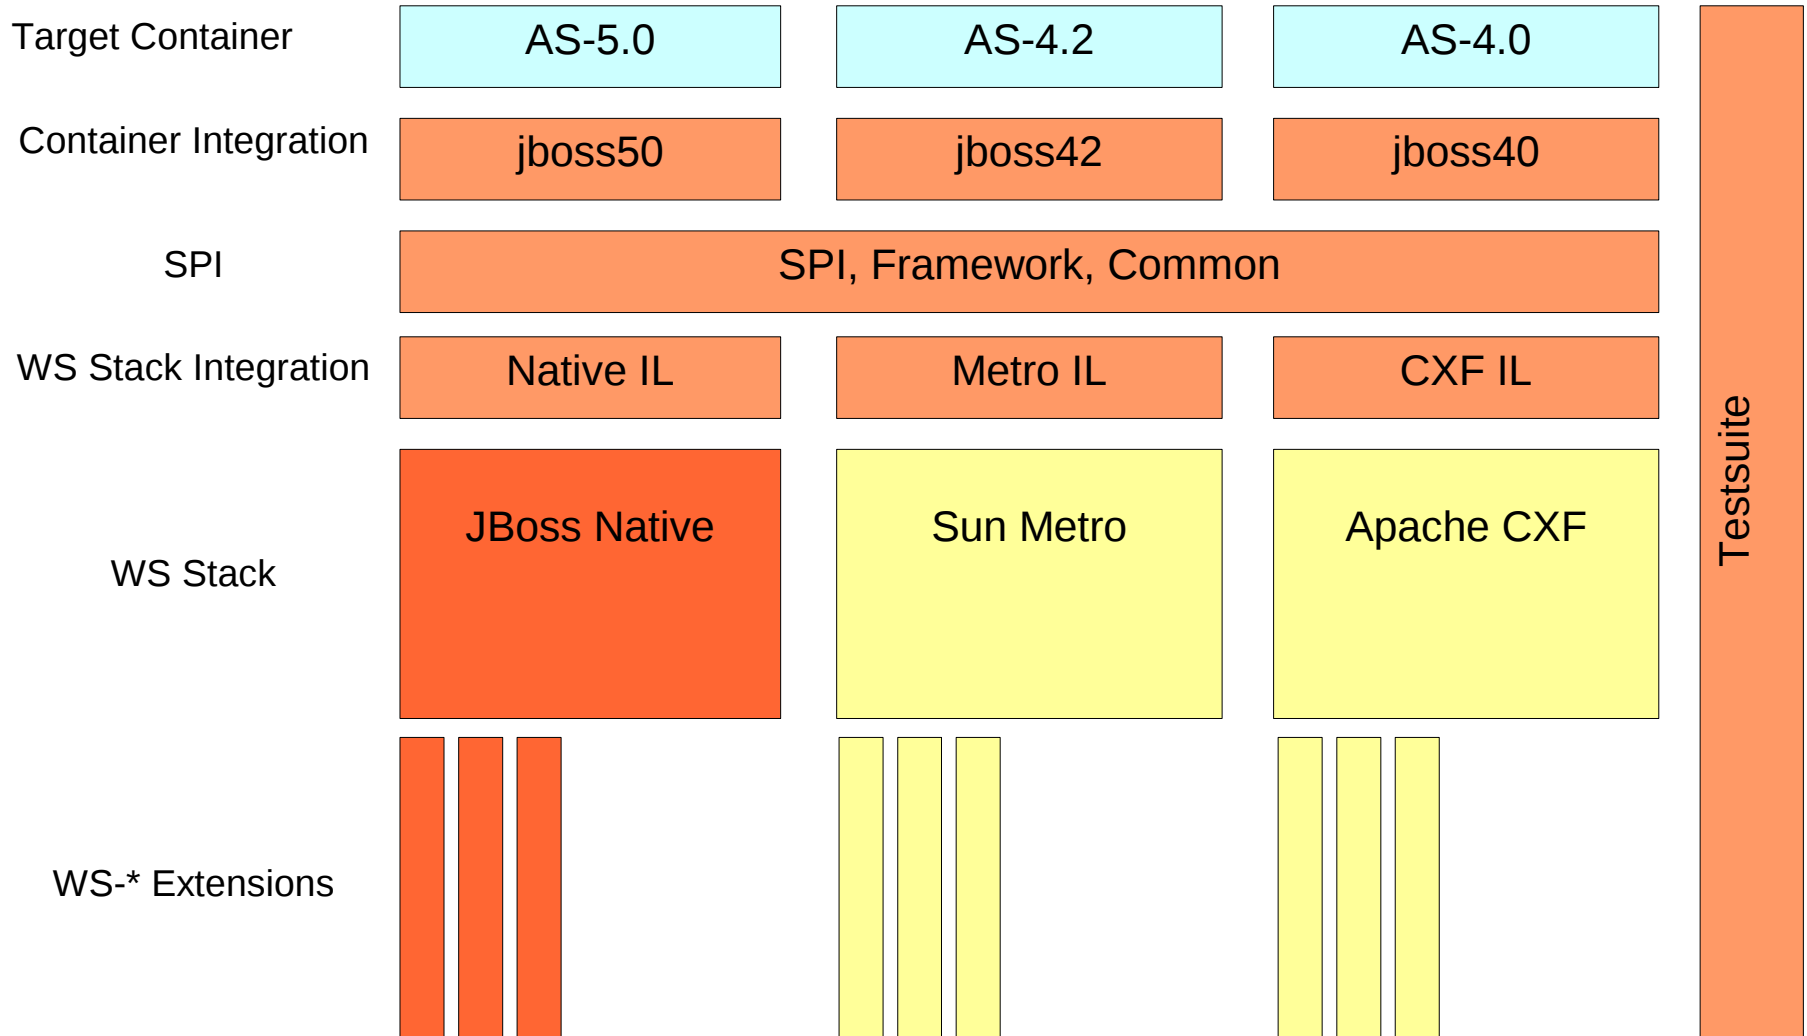

Bob McWhirter's

- Rails on...
 - Jboss-Rails deployer on...
 - JBoss AS5 CR2, on...
 - RHEL 4, on...
 - A virtual appliance
-
- Demo?

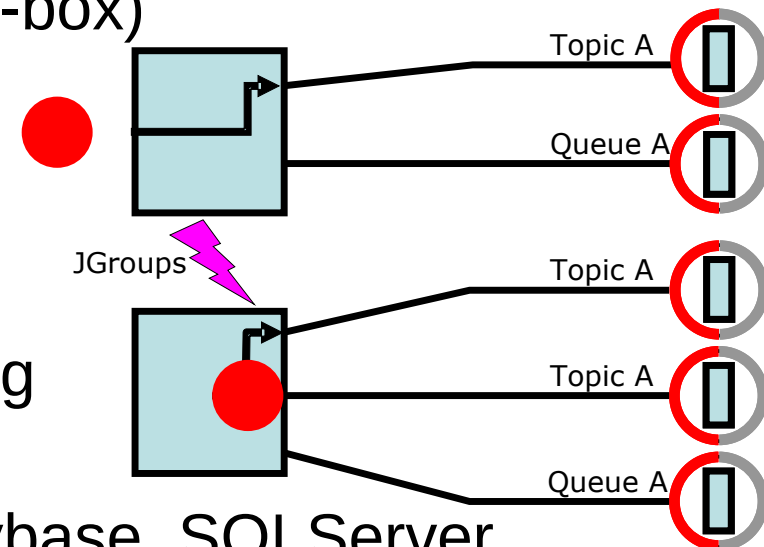

Feature Highlights

JBossWS 3.0.4

AS 5 - JBoss Messaging v1.4.1 Highlights

- High Performance JMS 1.1 compliant provider (Java5 only)
- XA implementation/integration with JBoss Transactions
- Clustered Queues and Topics (out-of-the-box)
- Intelligent message redistributions
- Transparent failover
- In memory message replication
- Support for very large messages & paging
- JDBC Persistence
Oracle, MySQL InnoDB, PostgreSQL, Sybase, SQLServer
- ... too many features to mention :-)

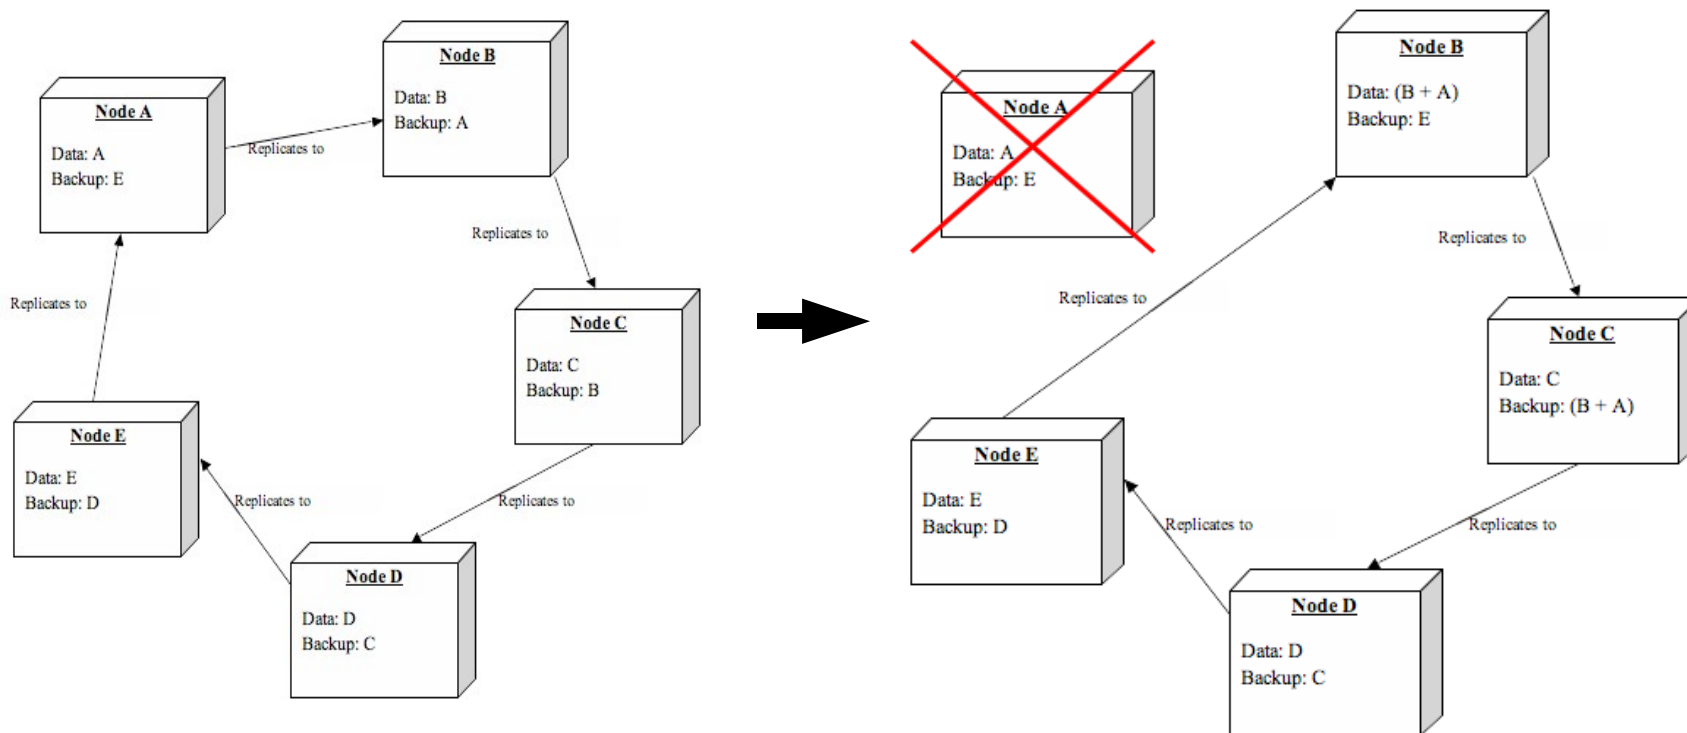

The Road Ahead : JBoss Messaging 2.0

- Completely JMS independent generic core.
- Bootstrappable in JBoss Microcontainer or any other dependency injection framework.
- Brand new NIO transport using Apache MINA. Supports TCP, SSL, HTTP and native APR.
- Very fast local append-only journaling store with Berkeley DB
- Improved JDBC persistence support using Hibernate
- Improved queue configuration and security
- Extended and more flexible HA

AS 5 - Clustering Highlights (JBC 3.0.0 / JGroups 2.6.7)

- Buddy replication for SFSBs
 - Replicate to a configurable # of backup nodes rather than to all other nodes
 - Improved memory, CPU, network utilization == Scalable!

AS 5 - Clustering Highlights (JBC 3.0.0 / JGroups 2.6.7)

- Multi Version Concurrency Control (MVCC)
 - Faster access for readers/writers, smaller mem. footprint
 -
- Passivation for clustered web sessions
 - Control memory usage; overflow to disk
- Much improved EJB3 Entity/Hibernate Caching
 - Separate Entity (invalidation) / Query (replication) Caches
- Clustered messaging server (JBoss Messaging)
 - JMS server no longer an HASingleton

AS 5 – JBoss Web 2.1.1 (Tomcat 6 on Steroids!)

- JBoss' own version of Tomcat 6
- Code stability and maintenance
- Integrates with JBoss Clustering
- Run inside JBoss AS (and soon Standalone)
- High performance
 - Java Connectors over JBoss Native (over Apache APR) match Apache httpd performance
- High concurrency (10k+ connections)
- Static file handling (low memory/cpu usage)
- Integrates OpenSSL (x6 - x10 performance)
- Linux, HP-UX, Solaris, Windows
 - Just drop jboss native in JBOSS_HOME/bin/native

mod-cluster

- Dynamic configuration of httpd workers
 - Static list
 - Dynamic discovery
- Server-side load balance factor calculation
- Fine grained web-app lifecycle control

Work-In-Progress

- EJB3 standalone
- EJB3.1 / Web Profile / Java EE 6
- Railo integration
- ...
- Document, explain, blog, experiment, test-drive, have fun and spread the word :-)

Q & A
